#### MINIMAX PROBLEMS

#### Example

Consider the following problem:

#### Example

Find smallest  $x \in \mathbb{R}$ , such that  $x + y \ge 1$ , where  $|y| \le 2$ .

In that example we need to find optimal value of x subject to a constraint where another unknown variable is present; the constraint has to be satisfied for the worst-case scenario, in this case it is y = -2. Solution is x = 3

This is closely related to minimax optimization

#### MINIMAX: LINEAR CONSTRAINT

Part 1

Consider the following problem:

$$\min_{\mathbf{x}} \max_{\mathbf{y}} \quad ||\mathbf{x}||, 
\text{subject to} \quad \mathbf{c}^{\top}\mathbf{x} + \mathbf{d}^{\top}\mathbf{y} \le h, 
\quad ||\mathbf{y}|| \le p$$
(1)

It is clear that worst-case scenario corresponds to the largest value of  $\mathbf{d}^{\top}\mathbf{y}$ , meaning that  $\mathbf{y}$  should align with  $\mathbf{d}$  and have its maximum possible length p. From that we conclude that  $\mathbf{y} = p \frac{\mathbf{d}}{||\mathbf{d}||}$ .

### MINIMAX: LINEAR CONSTRAINT

Part 2

Therefor  $\mathbf{c}^{\top}\mathbf{x} + \mathbf{d}^{\top}\mathbf{y} \leq h$  becomes:

$$\mathbf{c}^{\top}\mathbf{x} + p\frac{\mathbf{d}^{\top}\mathbf{d}}{||\mathbf{d}||} \le h \tag{2}$$

$$\mathbf{c}^{\top}\mathbf{x} + p||\mathbf{d}|| \le h \tag{3}$$

Thus our problem becomes:

$$\min_{\mathbf{x}} \qquad ||\mathbf{x}||, \\
\text{subject to} \quad \mathbf{c}^{\top} \mathbf{x} \le h - p||\mathbf{d}|| \tag{4}$$

## MINIMAX: QUADRATIC CONSTRAINT, TYPE 1 Part 1

Consider the following problem, where  $\mathbf{x}^*$  is the desired value of  $\mathbf{x}$ :

$$\min_{\mathbf{x}} \max_{\mathbf{y}} \quad ||\mathbf{x} - \mathbf{x}^*||, 
\text{subject to} \quad \mathbf{y}^\top \mathbf{D} \mathbf{x} \le h, 
\quad ||\mathbf{y}|| \le p$$
(5)

This time worst-case scenario corresponds to  $\mathbf{y}$  aligned with  $\mathbf{D}\mathbf{x}$  and having its maximum possible length p. From that we conclude that  $\mathbf{y} = p \frac{\mathbf{D}\mathbf{x}}{||\mathbf{D}\mathbf{x}||}$ . Let us substitute it to  $\mathbf{y}^{\top}\mathbf{D}\mathbf{x}$ :

$$p\left(\frac{\mathbf{D}\mathbf{x}}{||\mathbf{D}\mathbf{x}||}\right)^{\top}\mathbf{D}\mathbf{x} = p\frac{\mathbf{x}^{\top}\mathbf{D}^{\top}\mathbf{D}\mathbf{x}}{||\mathbf{D}\mathbf{x}||} = p\frac{||\mathbf{D}\mathbf{x}||^{2}}{||\mathbf{D}\mathbf{x}||} = p||\mathbf{D}\mathbf{x}||$$
(6)

by Sergei Savin

Minimax

# MINIMAX: QUADRATIC CONSTRAINT, TYPE 1 Part 2

Thus our problem becomes:

$$\min_{\mathbf{x}} \qquad ||\mathbf{x} - \mathbf{x}^*||, 
\text{subject to} \quad ||\mathbf{D}\mathbf{x}|| \le \frac{h}{p}$$
(7)

which is an SOCP.

# MINIMAX: QUADRATIC CONSTRAINT, TYPE 2 Part 1

A more general case of the previous problem is:

$$\min_{\mathbf{x}} \max_{\mathbf{y}} \quad ||\mathbf{x} - \mathbf{x}^*||, 
\text{subject to} \quad (\mathbf{y} - \mathbf{a})^\top \mathbf{D}(\mathbf{x} - \mathbf{b}) \le h, 
||\mathbf{y}|| \le p$$
(8)

We can rewrite  $(\mathbf{y} - \mathbf{a})^{\top} \mathbf{D} (\mathbf{x} - \mathbf{b}) \leq h$  as:

$$\mathbf{y}^{\top} \mathbf{D}(\mathbf{x} - \mathbf{b}) - \mathbf{a}^{\top} \mathbf{D}(\mathbf{x} - \mathbf{b}) \le h \tag{9}$$

With that we see that the worse case scenario is  $\mathbf{y}$  is aligned with  $\mathbf{D}(\mathbf{x} - \mathbf{b})$  and has length p:

$$\mathbf{y} = p \frac{\mathbf{D}(\mathbf{x} - \mathbf{b})}{||\mathbf{D}(\mathbf{x} - \mathbf{b})||} \tag{10}$$

# MINIMAX: QUADRATIC CONSTRAINT, TYPE 2 Part 2

Then  $\mathbf{y}^{\top}\mathbf{D}(\mathbf{x} - \mathbf{b}) - \mathbf{a}^{\top}\mathbf{D}(\mathbf{x} - \mathbf{b}) \leq h$  becomes:

$$p\frac{(\mathbf{x} - \mathbf{b})^{\top} \mathbf{D}^{\top} \mathbf{D} (\mathbf{x} - \mathbf{b})}{||\mathbf{D} (\mathbf{x} - \mathbf{b})||} - \mathbf{a}^{\top} \mathbf{D} (\mathbf{x} - \mathbf{b}) \le h$$
 (11)

which is the same as:

$$p||\mathbf{D}(\mathbf{x} - \mathbf{b})|| - \mathbf{a}^{\mathsf{T}}\mathbf{D}(\mathbf{x} - \mathbf{b}) \le h$$
 (12)

$$||\mathbf{D}(\mathbf{x} - \mathbf{b})|| \le \frac{1}{p} \mathbf{a}^{\mathsf{T}} \mathbf{D}(\mathbf{x} - \mathbf{b}) + \frac{h}{p}$$
 (13)

which is an SOCP constraint.

# MINIMAX: QUADRATIC CONSTRAINT, TYPE 2 Part 2

And thus we get:

$$\min_{\mathbf{x}} \qquad ||\mathbf{x} - \mathbf{x}^*||, 
\text{subject to} \quad ||\mathbf{D}(\mathbf{x} - \mathbf{b})|| \le \frac{1}{p} \mathbf{a}^\top \mathbf{D}(\mathbf{x} - \mathbf{b}) + \frac{h}{p} \tag{14}$$

which is SOCP.

# MINIMAX: QUADRATIC CONSTRAINT, TYPE 3 Part 1

A more general case of the previous problem is:

$$\min_{\mathbf{x}} \max_{\mathbf{y}} \quad ||\mathbf{x} - \mathbf{x}^*||, 
\text{subject to} \quad (\mathbf{y} - \mathbf{a})^{\top} \mathbf{D}(\mathbf{x} - \mathbf{b}) \leq h, 
\quad ||\mathbf{H}\mathbf{y} + \mathbf{f}|| \leq p$$
(15)

where  $\mathbf{H}$  is has an inverse. We start by making substitution:

$$\mathbf{v} = \mathbf{H}\mathbf{y} + \mathbf{f} \tag{16}$$

meaning  $\mathbf{y} = \mathbf{H}^{-1}(\mathbf{v} - \mathbf{f})$ :

$$(\mathbf{H}^{-1}(\mathbf{v} - \mathbf{f}) - \mathbf{a})^{\top} \mathbf{D}(\mathbf{x} - \mathbf{b}) \le h \tag{17}$$

$$\mathbf{v}^{\mathsf{T}}\mathbf{H}^{-\mathsf{T}}\mathbf{D}(\mathbf{x} - \mathbf{b}) - (\mathbf{H}^{-1}\mathbf{f} + \mathbf{a})^{\mathsf{T}}\mathbf{D}(\mathbf{x} - \mathbf{b}) \le h$$
 (18)

$$\mathbf{v}^{\mathsf{T}}\mathbf{H}^{-\mathsf{T}}\mathbf{D}(\mathbf{x} - \mathbf{b}) - (\mathbf{H}\mathbf{a} + \mathbf{f})^{\mathsf{T}}\mathbf{H}^{-\mathsf{T}}\mathbf{D}(\mathbf{x} - \mathbf{b}) \le h$$
 (19)

# MINIMAX: QUADRATIC CONSTRAINT, TYPE 3 Part 2

We can introduce notation:

$$\mathbf{M} = \mathbf{H}^{-\top} \mathbf{D} \tag{20}$$

$$\mathbf{g} = \mathbf{H}\mathbf{a} + \mathbf{f} \tag{21}$$

With that we can re-write our constraint:

$$\mathbf{v}^{\top} \mathbf{M} (\mathbf{x} - \mathbf{b}) - \mathbf{g}^{\top} \mathbf{M} (\mathbf{x} - \mathbf{b}) \le h$$
 (22)

$$(\mathbf{v} - \mathbf{g})^{\top} \mathbf{M} (\mathbf{x} - \mathbf{b}) \le h \tag{23}$$

And now we formulated type 3 problem as type 2:

$$\min_{\mathbf{x}} \max_{\mathbf{v}} \quad ||\mathbf{x} - \mathbf{x}^*||, 
\text{subject to} \quad (\mathbf{v} - \mathbf{g})^{\top} \mathbf{M} (\mathbf{x} - \mathbf{b}) \leq h, 
\quad ||\mathbf{v}|| \leq p$$
(24)

### MINIMAX: QUADRATIC CONSTRAINT, TYPE 4

Try solving this problem on your own:

$$\min_{\mathbf{x}} \max_{\mathbf{y}} \quad ||\mathbf{x} - \mathbf{x}^*||, 
\text{subject to} \quad (\mathbf{y} - \mathbf{a})^{\top} \mathbf{D}(\mathbf{x} - \mathbf{b}) + \mathbf{s}^{\top} \mathbf{y} + \mathbf{q}^{\top} \mathbf{x} \le h, 
||\mathbf{H} \mathbf{y} + \mathbf{f}|| \le p$$
(25)

Consider the system:

$$\dot{\mathbf{x}} = \mathbf{A}_p \mathbf{x} + \mathbf{B}_p \mathbf{u} \tag{26}$$

where  $\mathbf{A}_p$  and  $\mathbf{B}_p$  are linear functions of parameters  $\mathbf{p}$ . We want to stabilize the origin.

Assume we use control law:

$$\mathbf{u} = -\mathbf{K}\mathbf{x} + \mathbf{u}^* \tag{27}$$

With that we get:

$$\dot{\mathbf{x}} = (\mathbf{A}_p - \mathbf{B}_p \mathbf{K}) \mathbf{x} + \mathbf{B}_p \mathbf{u}^* \tag{28}$$

Let us write Lyapunov function for the system:

$$V = \mathbf{x}^{\top} \mathbf{S} \mathbf{x} \tag{29}$$

$$\dot{V} = \dot{\mathbf{x}}^{\mathsf{T}} \mathbf{S} \mathbf{x} + \mathbf{x}^{\mathsf{T}} \mathbf{S} \dot{\mathbf{x}} = \tag{30}$$

$$= \mathbf{x}^{\top} \mathbf{S} (\mathbf{A}_p - \mathbf{B}_p \mathbf{K}) \mathbf{x} + \mathbf{x}^{\top} (\mathbf{A}_p - \mathbf{B}_p \mathbf{K})^{\top} \mathbf{S} \mathbf{x} +$$
(31)

$$+ \mathbf{x}^{\mathsf{T}} \mathbf{S} \mathbf{B}_{p} \mathbf{u}^{*} + \mathbf{u}^{*\mathsf{T}} \mathbf{B}_{p}^{\mathsf{T}} \mathbf{S} \mathbf{x}$$
 (32)

Let us define:

$$a = 2\mathbf{x}^{\mathsf{T}}\mathbf{S}(\mathbf{A}_p - \mathbf{B}_p\mathbf{K})\mathbf{x} \tag{33}$$

$$\mathbf{b} = 2\mathbf{x}^{\mathsf{T}}\mathbf{S}\mathbf{B}_{p} \tag{34}$$

With that we can find Jacobians:

$$\mathbf{a}_{x} = \frac{\partial a}{\partial \mathbf{p}} \qquad \mathbf{B}_{x} = \frac{\partial \mathbf{b}}{\partial \mathbf{p}} \qquad (35)$$

Thus we get minimax constraint on the Lyapunov function

$$\dot{V} = \mathbf{a}_x^{\top} \mathbf{p}_t + \mathbf{u}^{*\top} \mathbf{B}_x \mathbf{p}_t \tag{36}$$

where  $\mathbf{p}_t$  are true values of parameters  $\mathbf{p}$ . Assuming:

$$\mathbf{p}_t = \mathbf{p} + \mathbf{p}_0 \tag{37}$$

we get:

$$\dot{V} = \mathbf{a}_x^{\top} (\mathbf{p} + \mathbf{p}_0) + \mathbf{u}^{*\top} \mathbf{B}_x (\mathbf{p} + \mathbf{p}_0)$$
 (38)

which is a minimax constraint. Let's solve it for the case  $||\mathbf{p}|| \leq 1$ .

Taking derivative of  $\dot{V}$  with respect to  $\bf{p}$  we get

$$\frac{\partial \dot{V}}{\partial \mathbf{p}} = \mathbf{a}_x^{\top} + \mathbf{u}^{*\top} \mathbf{B}_x \tag{39}$$

this is the direction where the function grow the most. But we know its length is 1, so we conclude that:

$$\mathbf{p} = \frac{\mathbf{a}_x^{\top} + \mathbf{u}^{*\top} \mathbf{B}_x}{||\mathbf{a}_x^{\top} + \mathbf{u}^{*\top} \mathbf{B}_x||}$$
(40)

So:

$$\dot{V} = ||\mathbf{a}_x^\top + \mathbf{u}^{*\top} \mathbf{B}_x|| + (\mathbf{a}_x^\top + \mathbf{u}^{*\top} \mathbf{B}_x) \mathbf{p}_0$$
 (41)

## ELLIPTICAL PARAMETER UNCERTAINTY Part 1

Let's do the same, but for the case when  $||\mathbf{Gp}|| \leq 1$ :

$$\begin{cases} \dot{V} = \mathbf{a}_x^{\top} (\mathbf{p} + \mathbf{p}_0) + \mathbf{u}^{*\top} \mathbf{B}_x (\mathbf{p} + \mathbf{p}_0) \le 0 \\ ||\mathbf{G}\mathbf{p}|| \le 1 \end{cases}$$
(42)

First step is to introduce new variable:

$$\rho = \mathbf{Gp} \tag{43}$$

from which it follows that  $\mathbf{p} = \mathbf{G}^{-1}\rho$  (**G** should be invertible for the parameters to be bounded). Hence we get:

$$\begin{cases} \dot{V} = \mathbf{a}_x^{\top} (\mathbf{G}^{-1} \rho + \mathbf{p}_0) + \mathbf{u}^{*\top} \mathbf{B}_x (\mathbf{G}^{-1} \rho + \mathbf{p}_0) \le 0 \\ ||\rho|| \le 1 \end{cases}$$
(44)

## ELLIPTICAL PARAMETER UNCERTAINTY Part 2

We can find gradient:

$$\frac{\partial \dot{V}}{\partial \mathbf{p}} = \mathbf{a}_x^{\mathsf{T}} \mathbf{G}^{-1} + \mathbf{u}^{*\mathsf{T}} \mathbf{B}_x \mathbf{G}^{-1}$$
 (45)

We know that length of  $\rho$  is bounded, so:

$$\rho = \frac{\mathbf{a}_x^{\top} \mathbf{G}^{-1} + \mathbf{u}^{*\top} \mathbf{B}_x \mathbf{G}^{-1}}{||\mathbf{a}_x^{\top} \mathbf{G}^{-1} + \mathbf{u}^{*\top} \mathbf{B}_x \mathbf{G}^{-1}||}$$
(46)

And thus we get SOCP constraint:

$$\dot{V} = ||\mathbf{a}_x^{\mathsf{T}}\mathbf{G}^{-1} + \mathbf{u}^{\mathsf{*T}}\mathbf{B}_x\mathbf{G}^{-1}|| + \mathbf{a}_x^{\mathsf{T}}\mathbf{p}_0 + \mathbf{u}^{\mathsf{*T}}\mathbf{B}_x\mathbf{p}_0 \le 0 \qquad (47)$$
